

PHASE 8: PROJECT DEMONSTRATION

8.1 Objective

The objective of the Demonstration Phase is to demonstrate the completed standard laptop procurement automation and explain how the workflow reduces manual processing.

8.2 Project Introduction

The demonstration begins with an introduction to the project problem and objective.

The presenter explains why standard laptop procurement was selected as the automation scenario.

8.3 Request Process Demonstration

The standard laptop request process is explained from the point at which a user submits the request.

The Service Catalog request is used as the starting point of the process.

8.4 Flow Designer Demonstration

The configured Flow Designer flow is shown to explain how the automation is structured.

The major components displayed include:

- Trigger.
- Condition.
- Approval.
- Approved branch.
- Rejected branch.
- Fulfilment/notification actions.

8.5 Trigger Demonstration

The trigger is demonstrated to show how the flow begins when the relevant request is submitted.

8.6 Condition Demonstration

The condition is demonstrated to explain how the flow identifies standard laptop requests.

8.7 Approval Demonstration

The approval process is demonstrated to show how the request is sent through the required approval stage.

8.8 Approved Path Demonstration

The approved path is demonstrated by showing how an approved request continues toward fulfilment and related notification actions.

8.9 Rejected Path Demonstration

The rejected path is also demonstrated.

This shows how the workflow handles a request that does not receive approval.

8.10 Execution Details

The flow execution details and testing evidence are shown to demonstrate that the configured automation has executed according to the design.

8.11 Benefits Explanation

The demonstration concludes by explaining the purpose and benefits of the automation, including:

- Reduction of manual processing.
- Improved task management.
- Faster processing of standard requests.
- More consistent request handling.
- Better process tracking and visibility.

8.12 Future Enhancement Discussion

Possible future improvements are also explained during the demonstration.

These include:

- Automatic inventory availability checking.
- Asset management integration.
- SLA tracking and escalation.
- Procurement dashboards.
- Extension to other IT equipment.
- Automated email or in-platform notifications.

8.13 Expected Output

The expected result of the demonstration is an end-to-end presentation of the complete request lifecycle:

Request Submission → Trigger → Condition → Approval → Fulfilment/Notification → Final Outcome

8.14 Phase Result

The final demonstration provides practical evidence that the configured ServiceNow Flow Designer automation can process a standard laptop request from submission through the final outcome.

OVERALL PROJECT WORKFLOW

The complete project can be represented using the following 8-phase development model:

Phase 1 – Brainstorming & Ideation

↓

Identify the manual IT procurement problem and propose automation.

Phase 2 – Requirement Analysis

↓

Identify users, inputs, conditions, approval requirements, actions, and expected outcomes.

Phase 3 – Project Design

↓

Design the Flow Designer structure and request-processing logic.

Phase 4 – Project Planning

↓

Prepare the environment, implementation sequence, test scenarios, documentation, and demonstration plan.

Phase 5 – Project Development

↓

Configure and activate the ServiceNow Flow Designer automation.

Phase 6 – Project Testing

↓

Test valid requests, approvals, rejections, conditions, notifications, and non-standard requests.

Phase 7 – Project Documentation

↓

Record the configuration, screenshots, test results, outcomes, limitations, and future enhancements.

Phase 8 – Project Demonstration

↓

Demonstrate the complete end-to-end automation.

CONCLUSION

The project **“Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer”** demonstrates the use of ServiceNow Flow Designer to automate a standard IT procurement process.

The project follows eight structured phases beginning with the identification of the procurement problem and continuing through requirement analysis, workflow design, implementation planning, development, testing, documentation, and final demonstration.

The implemented approach focuses on standard laptop requests. When a user submits a standard laptop request through the Service Catalog, the configured automation can trigger the required workflow and create a corresponding Catalog Task for the IT team. The workflow also supports approval, approved and rejected paths, notifications, status updates, and fulfilment-related actions.

The phase-wise approach provides a structured method for developing the project and demonstrates how automation can make the procurement process more organized, consistent, and easier to track.

The same approach can be extended to other standard IT equipment and service requests in the future.

FUTURE ENHANCEMENTS

The project document identifies several possible enhancements for future development:

1. **Automatic Inventory Availability Checking**

The system could check whether a suitable laptop is available before approval or fulfilment.

2. **Asset Management Integration**

Integration with asset management could allow the system to reserve or assign an available laptop automatically.

3. **SLA Tracking and Escalation**

SLA tracking could be introduced to monitor delayed approvals and support escalation.

4. **Procurement Dashboards**

Dashboards could provide visibility into procurement status, pending approvals, and fulfilment metrics.

5. **Support for Additional IT Equipment**

The same automation approach could be extended to standard monitors, keyboards, headsets, and other IT equipment.

6. **Automated Notifications**

Additional email or in-platform notifications could be introduced at important workflow stages.

TOOLS USED

The project uses the following tools and ServiceNow components:

- ServiceNow Platform
- Flow Designer
- Service Catalog
- Catalog Task Management

PROJECT OUTPUT

The final output of the project is a **working ServiceNow Flow Designer automation for standard laptop procurement**, supported by configuration evidence, testing results, documentation, and an end-to-end demonstration.
