

PHASE 5: PROJECT DEVELOPMENT

5.1 Objective

The objective of the Development Phase is to implement the designed laptop procurement automation using **ServiceNow Flow Designer**.

5.2 Creating the Flow

The first development activity is to open Flow Designer and create the required flow for standard laptop procurement.

The flow acts as the central automation mechanism for the project.

5.3 Configuring the Trigger

The trigger is configured to start the flow when the relevant procurement request is created or submitted.

Once the trigger conditions are satisfied, the flow begins processing the request.

5.4 Configuring the Condition

A condition is added to identify standard laptop requests.

This ensures that the automation processes the intended request type.

5.5 Configuring the Approval Action

The approval action is configured next.

The appropriate approver is specified so that the request can be reviewed before procurement or fulfilment continues.

5.6 Approved Path

The approved branch is created to continue the procurement or fulfilment process when the request receives approval.

The automated process proceeds according to the configured actions.

5.7 Rejected Path

A separate rejected branch is created to handle requests that are not approved.

This branch updates the request and informs the requester about the outcome.

5.8 Notifications and Additional Actions

Notifications or other required automation actions are configured as part of the flow.

These actions support communication and visibility during the request lifecycle.

5.9 Flow Validation

After configuration, the flow is saved and validated.

The flow is then activated after the configuration is complete.

5.10 Automated Task Creation

One important result of the implementation is the automation of the IT task generation process.

When a standard laptop request is submitted through the Service Catalog, the flow automatically creates a corresponding **Catalog Task** for the IT team. The requested item and task description can be mapped within the flow.

5.11 Expected Output

The expected output is a working ServiceNow Flow Designer automation for standard laptop procurement.

5.12 Phase Result

At the end of the Development Phase, the required flow, trigger, condition, approval action, approved branch, rejected branch, notifications, and related automation actions are configured and activated.
